## Manufacturing Management

## Manufacturing Management

- Every organization will manufacture their product under controlled conditions (manufacturing process parameters). Typically, every product will be manufactured by completing various operations in sequence. These operations are traditionally numbered as OP-10, OP-20, OP-30...
- Many organizations will have multiple lines/ machines for manufacturing which are operated by different Operators.
- It is important to track raw material/ child part traceability, along with productivity/ quality rate of each machine/ line, shift, Operators/ Inspectors and so on.

**This module facilitates capturing data related to production, process parameters, set-up approval, people working in production and quality areas, machine/ line details and batch number of raw material used for traceability purpose.**
